

On the 4th of May 2013, almost one year after the SARS-alike coronavirus sample was found by Dr. Zaki, Fouchier send the virus to Scientific Director Dr. Frank Plummer of Canada's National Microbiology Laboratory NML. NML is the Canadian Science Centre for Human and Animal Health, Arlington Street in Winnipeg, Canada. The Centre has a long history of offering comprehensive testing services for coronaviruses. It isolated and provided the first genome sequence of the SARS coronavirus and identified another coronavirus NL63 in 2004.

Having the actual virus allows to develop antibody tests which are key for a diagnosis of viral infections. Research was done in conjunction with the Canadian Food Inspection Agency's national lab, the National Centre for Foreign Animal Diseases which is housed in the same complex as the National Microbiology Laboratory.

W. 2. Researcher **Xiangguo Qiu** worked at this lab working on Ebola **vaccine**. ... done at University of North Carolina, Chapel Hill. It was headed by **Ralph Baric**.

Xiangguo Qiu was the head of the Vaccine Development and Antiviral Therapies Section in the Special Pathogens Program at Canada's NML. The viruses shipped from the NML to China studied by Qiu since 2014, were besides coronaviruses, Machupo, Junin, Rift Valley Fever, Crimean-Congo Hemorrhagic Fever and Hendra.

She and her husband Dr. Keding Cheng, also affiliated with the NML, and several Chinese were escorted from the National Microbiology Lab in Winnipeg on July 5, 2019. Since then, their appointments are ended, staff cautioned and traveling to China limited.
